[1] Data from APDA and RX List

[2] Patients treated with Parlodel, Mirapex, Requip, and Neupro have reported falling asleep while engaged in activities of daily living, including the operation of motor vehicles, which sometimes resulted in accidents.
Although many of these patients reported somnolence while on these drugs, some perceived that they had no warning signs such as excessive drowsiness, and believed that they were alert immediately prior to the event.
Some of these events have been reported more than 1 year after initiation of treatment.
Among the 613 patients who received REQUIP XL in clinical trials, there were 5 cases of sudden onset of sleep and 2 cases of motor vehicle accident in which it is not known if falling asleep was a contributing factor.
